## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 3\_Q4

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Sesha is developing a weather monitoring system for a region with multiple weather stations. Each weather station collects temperature data hourly and stores it in a 2D array.

Write a program that can add the temperature data from two different weather stations to create a combined temperature record for the region.

##### ***Input Format***

The first line of input consists of two space-separated integers N and M, representing the number of rows and columns of the matrices, respectively.

The next N lines consist of M space-separated integers, representing the values of the first matrix.

The following N lines consist of M space-separated integers, representing the values of the second matrix.

### **Output Format**

The output prints the addition of the two matrices in N rows and M columns, representing the combined temperature record.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 3 3

1 2 3

4 5 6

7 8 9

1 1 1

2 2 2

3 3 3

Output: 2 3 4

6 7 8

10 11 12

### **Answer**

```
import java.util.*;
class main{
    public static void main(String args[]){
        int a,b;
        Scanner obj=new Scanner(System.in);
        a=obj.nextInt();
        b=obj.nextInt();
        int[][] x=new int[a][b];
        int[][] y=new int[a][b];
        int[][] z=new int[a][b];
        for(int i=0;i<a;i++){
            for(int j=0;j<b;j++){
                x[i][j]=obj.nextInt();
            }
        }
        for(int i=0;i<a;i++){
            for(int j=0;j<b;j++){
```

```
        y[i][j]=obj.nextInt();
    }
}
for(int i=0;i<a;i++){
    for(int j=0;j<b;j++){
        z[i][j]=x[i][j]+y[i][j];
    }
}
for(int i=0;i<a;i++){
    for(int j=0;j<b;j++){
        System.out.println(z[i][j]);
    }
}
}
```

**Status :** Correct

**Marks : 10/10**
